Created the basis flow to generate the test cases along with memory

Verified the API collection generated for both .yaml and .json files and implemented the tag to enter the URL and process the swagger to generate the test cases

The screenshot shows the "Upload Swagger specification" form. The form has two tabs: "Upload file" and "Import from URL". The "Import from URL" tab is selected. Below the tabs, there is a text input field for the "Swagger / OpenAPI document URL" with the value "https://example.com/openapi.json". A "Fetch & validate" button is next to the input field. The form also includes a note: "Maximum 5 MB - must be reachable over http or https - .yaml, .yml, or .json content".

31 API testcases generated.
